

Summary :

In this assignment, I worked with a Combined_dataset which is shopping product dataset and performed basic data exploration and cleaning using Pandas. I started by loading the dataset and exploring its structure using functions such as head(), tail(), shape, columns, and info(). This helped me understand the dataset and identify missing values and duplicate records.

As part of the cleaning process, I handled missing values, removed duplicates, and performed basic filtering and column selection operations. To make the dataset more meaningful, I created a derived column called "product_quality", which classifies products based on their "ratings".

Finally, I saved the cleaned dataset as a new CSV file. Through this assignment, I gained practical experience in working with real-world data, performing data cleaning tasks, and using Pandas for data analysis and preprocessing.
